Alprazolam - is a potent short-acting drug of the benzodiazepine class. It is primarily used to treat moderate to severe anxiety disorders (e.g., social anxiety disorder) and panic attacks, and is used as an adjunctive treatment for anxiety associated with moderate depression. It is available in an instant release and an extended-release (However, from his clinical experience, Sheehan knew panic disorder to be both widespread among the populace and responsive to benzodiazepines. He suggested to Upjohn that marketing alprazolam for panic disorder would both cover new diagnostic territory and emphasize the unique potency of this drug. Sheehan describes the first group of patients treated by alprazolam as so impressed by its action that the company knew outright that the drug was going to be a hit. A few of those patients actually pooled their money and purchased stock in Upjohn. Several months later, when alprazolam was approved by the United States Food and Drug Administration, they sold out and made a profit. Xanax (Alprazolam) Drug Information: User Reviews, Side Effects, Drug Interactions and Dosage at RxListA reddish, scaly rash often located over the surfaces of the elbows, knees, scalp, and around or in the ears, navel, genitals or buttocks...XANAX Tablets (alprazolam) are indicated for the management of anxiety disorder (a condition corresponding most closely to the APA Diagnostic and Statistical Manual [DSM-III-R] diagnosis of generalized anxiety disorder) or the short-term relief of symptoms of anxiety. Anxiety or tension associated with the stress of everyday life usually does not require treatment with an anxiolytic. Panic disorder (DSM-IV) is characterized by recurrent unexpected panic attacks,

ie, a discrete period of intense fear or discomfort in which four (or more) of the following symptoms develop abruptly and reach a peak within 10 minutes: (1) palpitations, pounding heart, or accelerated heart rate; (2) sweating; (3) trembling or shaking; (4) sensations of shortness of breath or smothering; (5) feeling of choking; (6) chest pain or discomfort; (7) nausea or abdominal distress; (8) feeling dizzy, unsteady, lightheaded, or faint; (9) derealization (feelings of unreality) or depersonalization (being detached from oneself); (10) fear of losing control; (11) fear of dying; (12) paresthesias (numbness or tingling sensations); (13) chills or hot flushes.

What to do in case of Xanax overdose - by Erich Rosenberger M.D. - HeliumXanax is a commonly used tranquilizer that is type of benzodiazepine. Known by its generic name as alprazolam, Xanax must be used carefully and under the direct supervision of your doctor. The most common use for Xanax is short term control of anxiety or panic disorders. As with any medication, you must be careful not to take more than you are prescribed. If you should take an overdose of Xanax, either intentionally or by accident, you should call 911 or your doctor immediately.
